

COMP9444: Neural Networks and Deep Learning

Week 1c. Perceptrons

Alan Blair School of Computer Science and Engineering September 13, 2023

Structure of a Typical Neuron

Outline

- → Neurons Biological and Artificial
- → Perceptron Learning
- → Linear Separability
- → Multi-Layer Networks

Biological Neurons

The brain is made up of neurons (nerve cells) which have

- → a cell body (soma)
- → dendrites (inputs)
- → an axon (outputs)
- → synapses (connections between cells)

Synapses can be *exitatory* or *inhibitory* and may change over time. When the inputs reach some threshhold an *action potential* (electrical pulse) is sent along the axon to the outputs.

Artificial Neural Networks

(Artificial) Neural Networks are made up of nodes which have

- → inputs edges, each with some weight
- → outputs edges (with weights)
- → an activation level (a function of the inputs)

Weights can be positive or negative and may change over time (learning).

The *input function* is the weighted sum of the activation levels of inputs.

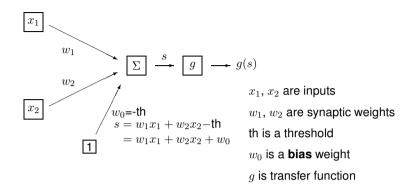

The activation level is a non-linear *transfer* function g of this input:

$$\mathsf{activation}_i = g(s_i) = g(\sum_j w_{ij} x_j)$$

Some nodes are inputs (sensing), some are outputs (action)

McCulloch & Pitts Model of a Single Neuron

UNSW

Transfer function

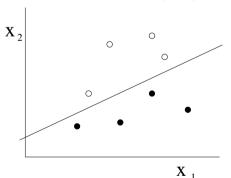

Originally, a (discontinuous) step function was used for the transfer function:

(Later, other transfer functions were introduced, which are continuous and smooth)

Linear Separability

Question: what kind of functions can a perceptron compute?

Answer: linearly separable functions

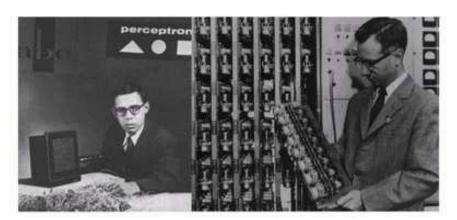

Linear Separability

Examples of linearly separable functions:

Q: How can we train it to learn a new function?

Perceptron Learning Rule

Adjust the weights as each input is presented.

recall:
$$s = w_1x_1 + w_2x_2 + w_0$$

if
$$g(s) = 0$$
 but should be 1, if $g(s) = 1$ but should be 0,

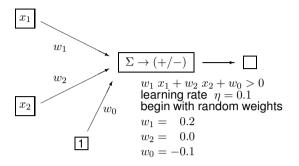

$$\begin{aligned}
 w_k &\leftarrow w_k + \eta \, x_k \\
 w_0 &\leftarrow w_0 + \eta \end{aligned}
 \qquad \begin{aligned}
 w_k &\leftarrow w_k - \eta \, x_k \\
 w_0 &\leftarrow w_0 - \eta
 \end{aligned}$$

so
$$s \leftarrow s + \eta \left(1 + \sum_{k} x_k^2\right)$$
 so $s \leftarrow s - \eta \left(1 + \sum_{k} x_k^2\right)$

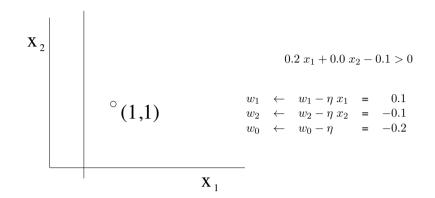

otherwise, weights are unchanged. ($\eta > 0$ is called the **learning rate**)

Theorem: This will eventually learn to classify the data correctly, as long as they are **linearly separable**.

Perceptron Learning Example

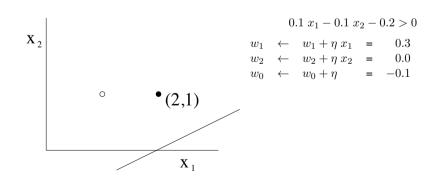

Training Step 1

Training Step 2

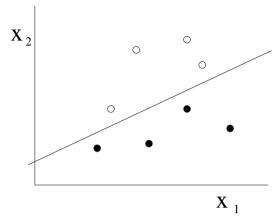

Training Step 3

₩ UNSW

UNSW

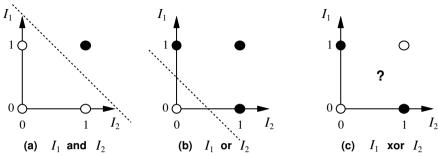

Final Outcome

eventually, all the data will be correctly classified (provided it is linearly separable)

Limitations of Perceptrons

Problem: many useful functions are not linearly separable (e.g. XOR)

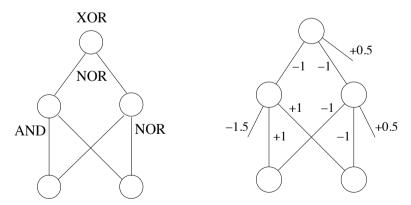

Possible solution:

 x_1 XOR x_2 can be written as: $(x_1 \text{ AND } x_2) \text{ NOR } (x_1 \text{ NOR } x_2)$ Recall that AND, OR and NOR can be implemented by perceptrons.

Multi-Layer Neural Networks

Problem: How can we train it to learn a new function? (credit assignment)

Historical Context

In 1969, Minsky and Papert published a book highlighting the limitations of Perceptrons, and lobbied various funding agencies to redirect funding away from neural network research, preferring instead logic-based methods such as expert systems.

It was known as far back as the 1960's that any given logical function could be implemented in a 2-layer neural network with step function activations. But, the the question of how to learn the weights of a multi-layer neural network based on training examples remained an open problem. The solution, which we describe in the next section, was found in 1976 by Paul Werbos, but did not become widely known until it was rediscovered in 1986 by Rumelhart, Hinton and Williams.
